About NamSor

NamSor™ is a European vendor of Name Recognition Software. We offer specialized data mining to recognize the origin of personal names in any alphabet / language, with fine grain and high accuracy. NamSor's mission is **to help understand international flows of money, ideas and people.**

Please, reach us at contact@namsor.com or follow us on [Twitter](#)

Introduction

If you are reading this tutorial, you probably have already installed RapidMiner and gained some experience by playing around with the enormous set of operators.

At NamSor, we intend to deliver a set of operators for mining **proper names** in all geographies/alphabets/languages/cultures. We decided to start with a *seemingly* simple operator GendRE Genderizer, to predict the likely gender of a personal name. Other useful operators will come in 2014.

Guessing the gender of name is not as simple as it seems:

- Andrea is a male name in Italy, a female name in the US. Laurence is a female name in France and a male name in the UK or in the US
- name demographics evolve, some names are genderless
- in Chinese or Korean, guessing the gender is almost impossible in Latin script, truly difficult even with the original script
- in most cultures, the gender is 'encoded' in the first name, in others it is encoded in the last name as well (for example, Slavic names, Lithuanian names ...) so you can guess the gender even if you have just the initials (for example, O. Sokolova is most likely a Slavic name and a female name)
- some names are very rare or just 'made up' and yet, because they *sound* like a male name or a female name, their gender is accurately perceived by the people in that same culture

GendRE API goal is to hide this complexity, offer a simple interface and return an optimal result:

[api/json/gendre/John/Smith](#)
{ "scale": -0.99, "gender": "male" }

Can you guess the result of the following?

api/json/gendre/נתניהו/בנימין/il
api/json/gendre/声涛/周
api/json/gendre/المرء بي/معين/lb

Currently, we require input names to be properly parsed into a (firstName, lastName) format and our machine learning algorithm will progressively discover how names are parsed in different cultures. When this calibration is complete, we'll offer an even simpler interface.

In RapidMiner, simply connect the GendRE Genderizer operator in your process to infer the gender of a personal name and create new data/new segmentation.

Getting Started

This section will get you started with NamSor Onomastics Extension.

Installation

Pre-compiled extension binaries can be found in GitHub /dist/ directory.

Use RapidMiner MarketPlace:

// add snapshot

Install manually in RapidMiner 6:

Copy the Extension binary into RapidMiner extension directory. For example, on Windows:

C:\Program Files\RapidMiner\RapidMiner Studio\lib\plugins\rapidminer-NamSor-6.0.001.jar

Install manually in RapidMiner 5.3:

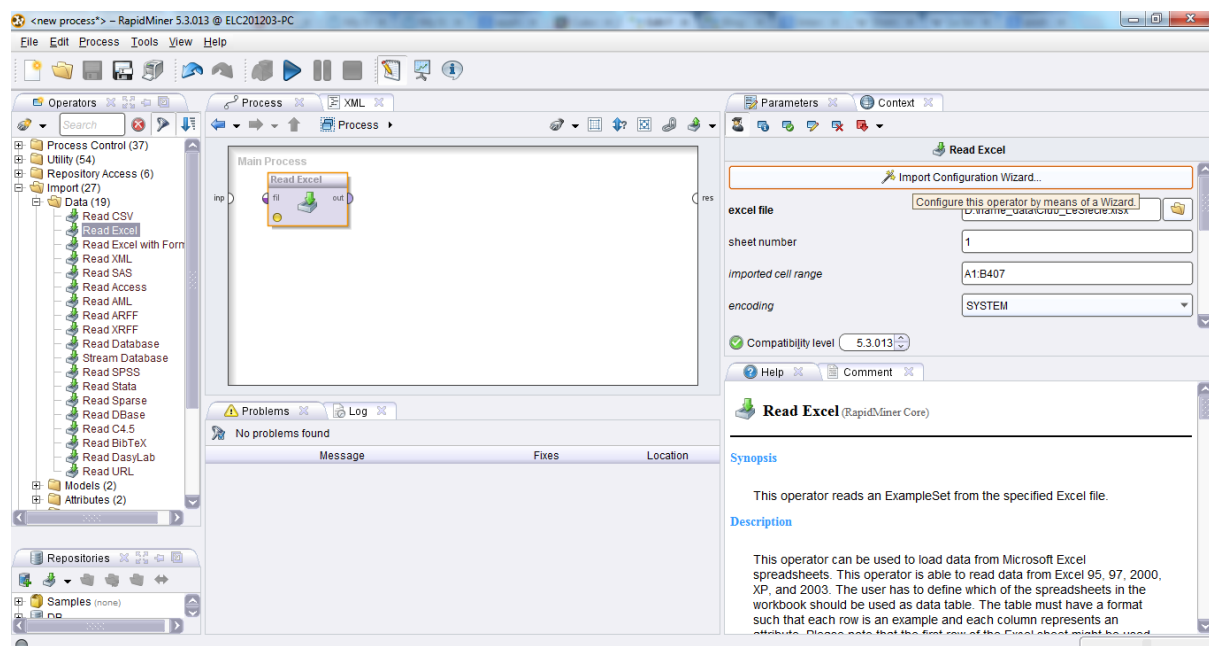

Copy the Extension binary into RapidMiner extension directory. For example, on Windows:

C:\Program Files (x86)\Rapid-I\RapidMiner5\lib\plugins\rapidminer-NamSor-5.3.001.jar

Create your first process

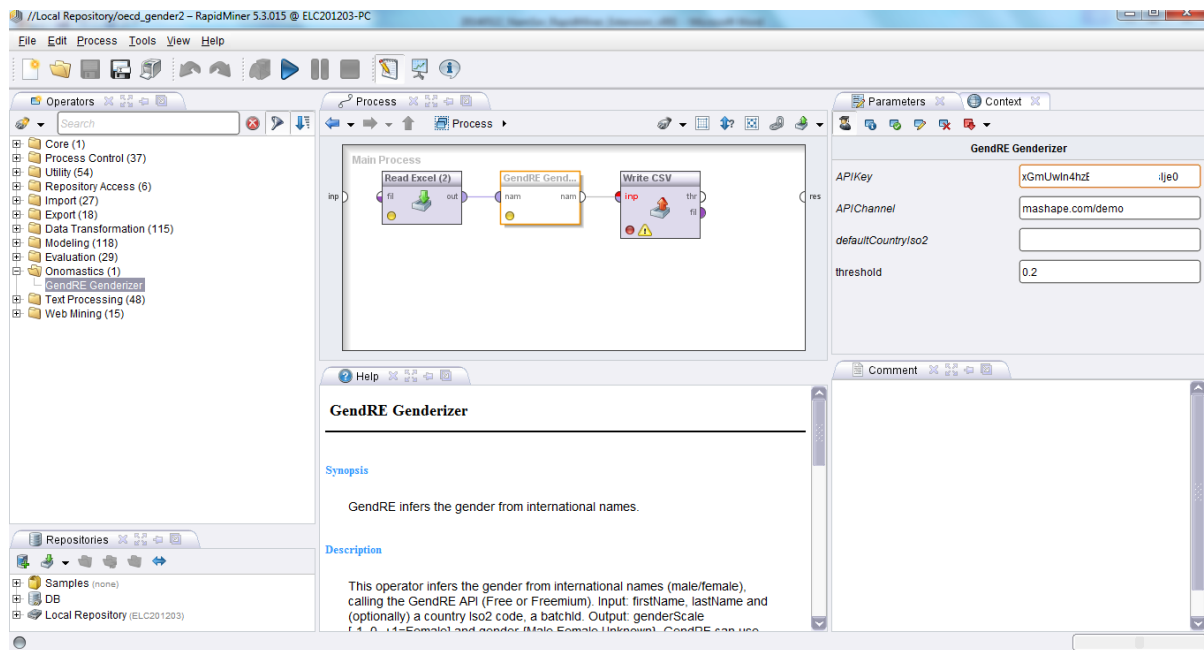

Create a simple Excel document with columns firstName, lastName and a few contacts.

Drag and drop the Read Excel operator (Import->Data->Read Excel) and launch the Import Configuration Wizard.

Default values should be OK through the wizard, except Encoding should be set to UTF-8 (Unicode, especially required if you would like to genderize Chinese, Russian or Arabic names).

Drag and drop the GendRE Genderizer operator (Operators>Onomastics> GendRE Genderizer) and connect it with the Excel file and a CSV exporter to view the results.

Leave the APIKey / APIChannel blanks to use the free GendRE API.

Network/API troubleshooting

In case of network error,

- check that you can access the API from behind your proxy, using your ordinary browser

<http://api.onomastic.com/onomastics/api/json/gendre/John/Smith>
{ "scale": -0.99, "gender": "male" }

- check your RapidMiner proxy configuration in Tools>Preferences>System

Ordering and getting support

Please report any issue with the software or the GendRE API via GitHub

<https://github.com/namsor/rapidminer-onomastics-extension/issues>

You can upgrade the GendRE API (better precision) and subscribe for commercial support.

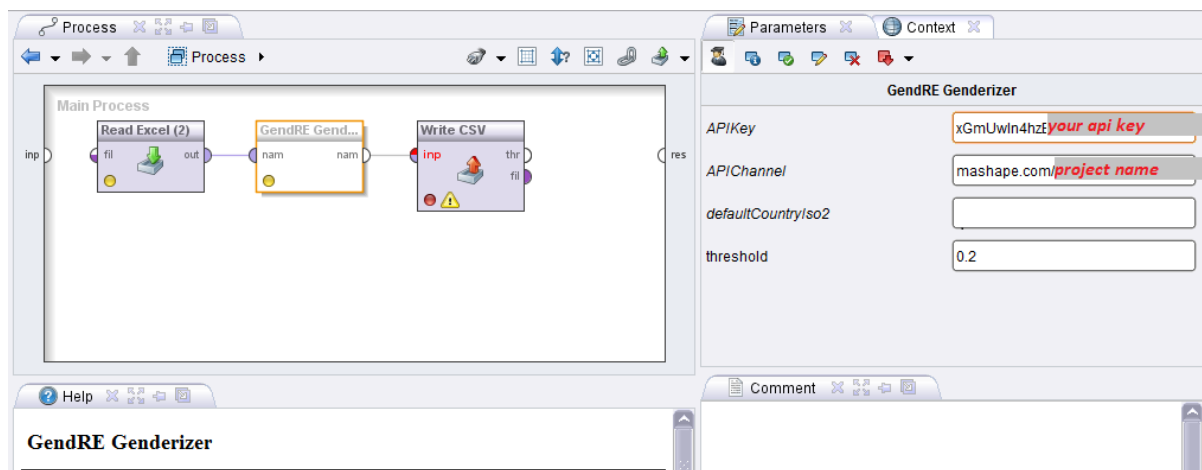

GendRE API Freemium on Mashape

- Register on [Mashape.com](https://www.mashape.com) to obtain an API Key

<https://www.mashape.com/namsor/>

- API Key: enter your Mashape.com API Key

- API Channel: enter **mashape.com/project_name**

- to report an issue or ask a question to our support team, please use

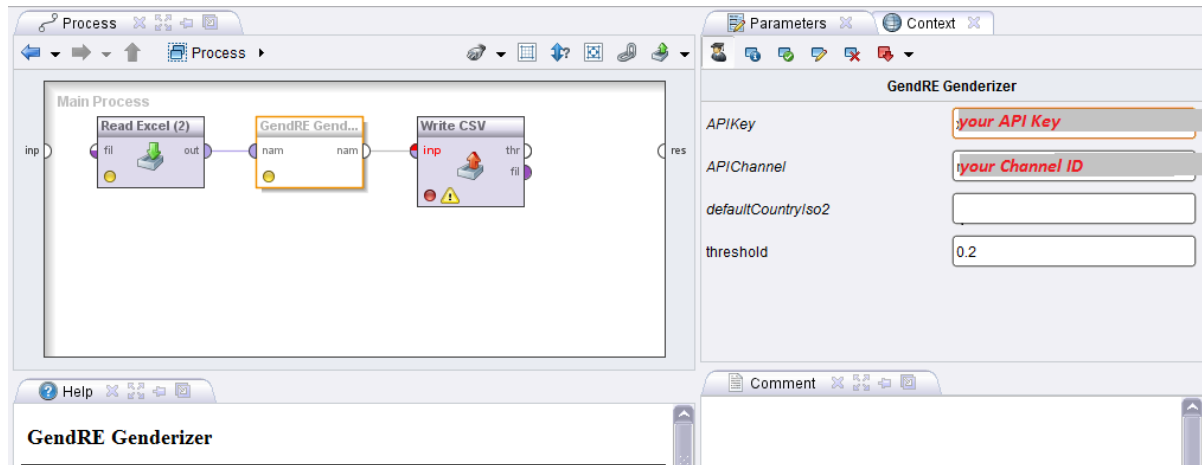

<https://www.mashape.com/namsor/gendre-infer-gender-from-world-names#!issues>

Premium Corporate Customers and RapidMiner MarketPlace Customers

Your will have been provided with the following information:

- API Key: enter your API Key
- API Channel : enter your Channel and Contract ID, for example

namsor.com/client_id/project_id

Cloud processing & on-premise software

If you need to process very large datasets in very a short time span, start first with a Freemium/Premium offer of GendRE API to prepare and test your process, then contact our professional services via the support tool.

Licensing
